No load stability on outriggers with 23-38 ft. tele. jib installed:

	Tele-jib fully ret. 93 ft.	33 ft. Tele-jib 103 ft.	Tele-jib fully ext. 108 ft.
Min. boom angle for indicated boom length	2°	4°	6°
Max. boom length including jib for 0° boom angle	92.5 ft.	101.7 ft.	106.4 ft.

JIB CAPACITY NOTES

- 23' (7.1m) Tele. Jib length may be used for double line lifting service. 33' (10.1m) and 38' (11.6m) jib lengths may be used for single line lifting service only. Capacities are based on structural strength of 23'-38' (7.1m-11.6m) Tele. Jib at a given main boom angle regardless of main boom length.
- WARNING: Operation of machine with heavier loads than the capacities listed is strictly prohibited. Machine tipping with jib occurs rapidly and without advance warning.
- Capacities listed are with fully extended outriggers only.
- WARNING: Lifting on rubber with jib is prohibited.
- Reference radii listed are for fully extended boom only 70' (21.2m).

23 ft. JIB with 28-70 ft. BOOM	
*Stowed	- 250 lbs.
*Erected	- 1,985 lbs.

23-38 ft. TELE. JIB with 28-70 ft. BOOM	
*Stowed	- 414 lbs.
*Erected (Retracted)	- 3,659 lbs.
*Erected (Extended)	- 4,611 lbs.

*Reduction of main boom capacities.

WEIGHT REDUCTIONS FOR LOAD HANDLING DEVICES

Maximum boom length (ft.) at 0 deg. boom angle (no load) 70								

NOTE: Boom angles are in degrees.

A6-829-006363 & -003716E

- Fated loads do not account for wind on lifted load or boom. It is recommended when wind velocity is above 20 mph (32 km/h), rated loads and boom lengths be appropriately reduced.
- Fated loads are for lift crane service only.
- Do not operate at a radius or boom length where capacities are not listed. At these positions, the crane may overturn without any load on the hook.
- The maximum load which can be telescoped is not definable because of variations in loadings and crane maintenance, but it is safe to attempt retraction and extension within the limits of the capacity chart.
- When either boom length or radius or both are between values listed, the smallest load shown at either the next larger radius or boom length shall be used.
- For safe operation, the user shall make due allowances for his particular job conditions, such as: soft or uneven ground, out of level conditions, high winds, side loads, pendulum action, jerking or sudden stopping of loads, hazardous conditions, experience of personnel, two machine lifts, traveling with loads, electric wires, etc. Side pull on boom or jib is extremely dangerous.
- Power telescoping boom sections must be extended equally at all times.
- Handling of personnel from the boom is not authorized except with equipment furnished and installed by Grove Manufacturing Company.
- Keep load handling devices a minimum of 18 inches (45.7 cm) below boom head at all times.
- The boom angle before loading should be greater than the loaded boom angle to account for deflection.
- Capacities appearing above the bold line are based on structural strength and tipping should not be relied upon as a capacity limitation.
- Capacities for the 28 ft. (8.6m) boom length shall be lifted with the boom fully retracted. If boom is not fully retracted, capacities shall not exceed those shown for the 34 ft. (10.4m).
- Radii less than 35 feet or 12 meters not recommended when lifting over front on machine. (Only applicable to machines equipped with front jack cylinder.)

DEFINITIONS:

- Operating Radius: Horizontal distance from a projection of the axis of rotation to the supporting surface before loading to the center of the vertical hoist line or tackle with load applied.
- Loaded Boom Angle (Shown in Parenthesis on Main Boom Capacity Chart): is the angle between the boom base section and the horizontal, after lifting the rated load at the rated radius with the rated boom length.
- Working Area: Areas measured in a circular arc about the center line of rotation as shown on the working area diagram.
- Freely Suspended Load: Load hanging free with no direct external force applied except by the lift cable.
- Side Load: Horizontal force applied to the lifted load either on the ground or in the air.

LIFTING CAPACITY NOTES:

GENERAL:

- Rated loads as shown on capacity chart pertain to this crane as originally manufactured and equipped. Modifications to the crane or use of optional equipment other than that specified can result in a reduction of capacity. Use only the jib or boom extension supplied with this crane, do not substitute jibs or boom extensions without the written approval of Grove Mfg. Co.
- Construction equipment can be hazardous if improperly operated or maintained. Operation and maintenance shall be in compliance with the information in the Operator's and Safety Handbooks, Service and Parts Manuals supplied with this crane. If these manuals are missing, order replacements from the manufacturer.
- The operator and other personnel associated with this crane shall fully acquaint themselves with the latest applicable American National Standards Institute (ANSI) Safety Standards for cranes.

SETUP:

- The crane shall be leveled on a firm supporting surface. Depending on the nature of the supporting surface, it may be necessary to have structural supports of sufficient strength under the outrigger floats or tires to spread the load to a larger bearing surface.
- For outrigger operation, outriggers shall be fully extended with tires raised free of crane weight before operating the boom or lifting loads.
- When equipped with front jack cylinder, the front jack cylinder shall be set in accordance with the written procedure.
- When equipped with extendable counterweight, the counterweight shall be fully extended before operation.
- Tires shall be inflated to the recommended pressure before lifting on rubber.
- With certain boom and hoist tackle combinations, maximum capacities may not be obtainable with standard cable lengths.
- Rotation resistant wire rope is best suited for single line lifting operations. Consult the wire rope manufacturer for specific recommendations concerning multiple part reeving.
- Do not transport crane with boom extension or jib erected.

OPERATION:

- Rated loads at rated radius shall not be exceeded. Do not tip the machine to determine allowable loads. For clamshell operation, weight of load must not exceed 80% of rated lifting capacities.
- Rated loads do not exceed 85% of the tipping load as determined by SAE Crane Stability Test Code J-765a.
- Rated loads include the weight of hook block, slings and auxiliary lifting devices and their combined weights shall be subtracted from the listed ratings to obtain the net load which may be lifted.
- Load ratings are based on freely suspended loads. No attempt shall be made to move a load horizontally on the ground in any direction.

NOTE: Boom angles are in degrees.

Crane as originally manufactured and equipped. Any modification other than that specified can result in a reduction of lifting capacity. If a crane, do not substitute jibs or boom extensions.

Crane must be inspected, rated or maintained. Operation and maintenance instructions are found in the Safety Handbooks, Service and Parts Manuals and Lifting Capacity Charts. Operators shall be fully acquainted themselves with the latest industry Standards for cranes.

Operator shall determine the nature of the supporting surface, its strength and length under the outrigger floats or tires to spread the load.

Outrigger tires raised free of crane weight before operating.

Outrigger angle shall be set in accordance with the written instructions.

Boom shall be fully extended before operation.

Crane shall be on rubber.

Lifting capacities may not be obtainable with standard configurations.

For lifting operations. Consult the wire rope manufacturer's instructions.

Operator shall determine the machine to determine allowable loads. For rated lifting capacities.

Capacities determined by SAE Crane Stability Test Code.

When using auxiliary lifting devices and their combined weights shall be included.

Operator shall be made to move a load horizontally on the crane.

5. Rated loads do not account for wind on lifted load or boom. It is recommended when wind velocity is in excess of 10 mph (32 km/h), rated loads and boom lengths be appropriately reduced.

6. Rated loads are for lift crane service only.

7. Do not operate at a radius or boom length where capacities are not listed. At these positions, the crane may overturn without any load on the hook.

8. The maximum load which can be telescoped is not definable because of variations in loadings, maintenance, but it is safe to attempt retraction and extension within the limits of the capacity chart.

9. When either boom length or radius or both are between values listed, the smallest load shown at either the larger radius or boom length shall be used.

10. For safe operation, the user shall make due allowances for his particular job conditions, such as: soft ground, out of level conditions, high winds, side loads, pendulum action, jerking or sudden stopping, hazardous conditions, experience of personnel, two machine lifts, traveling with loads, electric wires pull on boom or jib is extremely dangerous.

11. Power telescoping boom sections must be extended equally at all times.

12. Handling of personnel from the boom is not authorized except with equipment furnished and installed by the Manufacturing Company.

13. Keep load handling devices a minimum of 18 inches (45.7 cm) below boom head at all times.

14. The boom angle before loading should be greater than the loaded boom angle to account for deflection.

15. Capacities appearing above the bold line are based on structural strength and tipping should not be considered as a capacity limitation.

16. Capacities for the 28 ft. (8.6m) boom length shall be lifted with the boom fully retracted. If boom is fully retracted, capacities shall not exceed those shown for the 34 ft. (10.4m).

17. Radii less than 35 feet or 12 meters not recommended when lifting over front on machine. (Only apply to machines equipped with front jack cylinder.)

DEFINITIONS:

1. Operating Radius: Horizontal distance from a projection of the axis of rotation to the supporting surface, measured to the center of the vertical hoist line or tackle with load applied.

2. Loaded Boom Angle (Shown in Parenthesis on Main Boom Capacity Chart): is the angle between the vertical section and the horizontal, after lifting the rated load at the rated radius with the rated boom length.

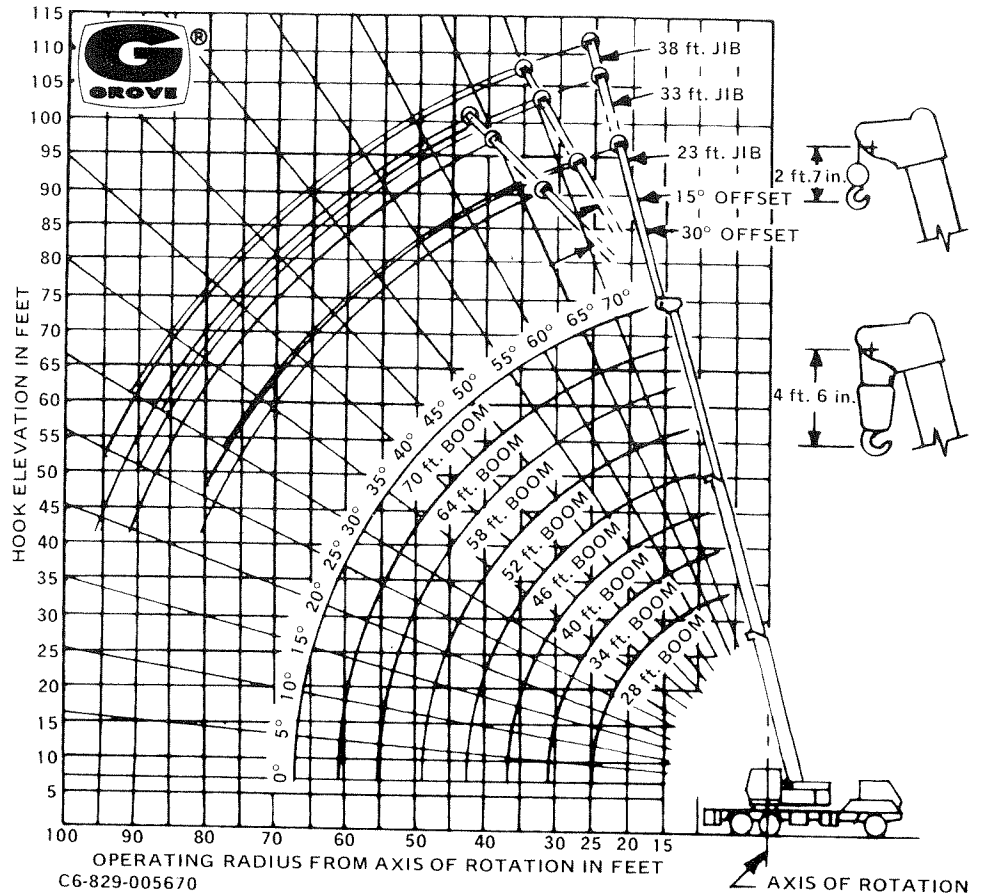

3. Working Area: Areas measured in a circular arc about the center line of rotation as shown on the capacity diagram.

4. Freely Suspended Load: Load hanging free with no direct external force applied except by the lift cable.

5. Side Load: Horizontal force applied to the lifted load either on the ground or in the air.

JIB CAPACITY NOTES:

- All capacities are in pounds 23 ft. jib may be used for double line lifting service. Capacities are based on structural strength of 23 ft. jib at a given main boom angle regardless of main boom length.
- WARNING:** Operation of machine with heavier loads than the capacities listed is strictly prohibited. Machine tipping with jib occurs rapidly and without advance warning.
- Capacities listed are with fully extended outriggers only.
- WARNING:** Lifting on rubber with jib is prohibited.
- Reference radii listed are for fully extended main boom only.
- No load stability on outriggers with 23 ft. jib installed:
 - Minimum boom angle for fully extended main boom = 0°.
 - Maximum boom length at 0° main boom angle = 93 ft.
