Note:

- (1)The rated load must comply with the EN 13000 standard.
- (2)The rated load is applicable to 360° working range.
- (3)The radius is the horizontal distance from central axle of slewing ring to centerline of lifting load.
- (4)The weight of load hook,wire rope and other load handling device subtracted from the rated load is the actual load.
- (5)When the crane is working with rated load, the ground must be flat and solid and its gradient must be less than 1%.
- (6)If the working radius of rated load and boom length are not listed in the table above,never operate the crane.
- (7)The boom configurations and relevant anchoring rods combination must be performed in accordance with the requirements in Operator's Manual.
- (8)A-frame must be erected in working conditions.
- (9)The tilting-back supports must be installed in any boom configurations.
- (10)The boom must be raised in front of crawler rather than the side of crawler.
- (11)The operation of crane must comply with the instructions in Operator's Manual.
- (12)In S-1 boom configuration,main boom can be fitted with tip boom,whose rated load is the same as that on main boom.But the maximum lifting capacity on tip boom can not exceed 7t.
- (13)The rated lifting capacity in the chart, which is obtained from the calculation when the load is suspended,is the reserved allowance for various operating factors such as the influence of wind load,ground gradient. The operating speed or any other condition may impose bad influences on safe operation of the crane.As a result, the crane operator must judge the present conditions and reduce the lifting load and operating speed correspondingly.
- (14)The notes here are also applicable to the following boom configurations.
